

Dunes Insolites — Launch Readiness Report

What remains before the platform is ready to publish, for any real user

Prepared 30 August 2026 — based on live verification against the running platform, not a code review alone

~68%

Ready today. The core booking flow, SEO migration, and Core Web Vitals are verified working end-to-end. What's left is concentrated in a small number of items — most need five minutes of your input, not more engineering.

1 — Blocking items that need you directly

Nothing else can close these — they need an account, a decision, or a fact only you have.

ITEM	WHAT'S NEEDED	STATUS
Gmail SMTP credential	The app-password from the old, leaked pre-monorepo repo is still live and unrevoked. Right now zero real emails send — no booking confirmation, no welcome/password email. Revoke the old app password in your Google Account (Security → App Passwords), generate a new one, and give me the value to place directly in <code>backend/.env</code> (never pasted in chat).	Blocking
Search Console export	Must happen <i>before</i> DNS points at this platform — Search Console's ranking/backlink history is tied to the current verified property. Export Performance (16-month CSV), Links, Coverage, and a Sitemaps screenshot. About 10 minutes, your login only.	Blocking, time-sensitive
Remote host verification	<code>79.143.185.33</code> is the default fallback host in <code>application.yml</code> . Unverified whether it's a live deployment, and if so, whether it still uses the leaked Keycloak secret. Needs checking directly on that host, not from here.	Blocking

2 — Real content pending your input

Deliberately left blank rather than invented — per the platform's own rule against fabricating tourism information.

ITEM	WHAT'S NEEDED	STATUS
Quad Safari — included/not-included	Every other activity has a real "what's included" list and short about-text; Quad Safari has none. Needs the real facts: is a helmet provided? Fuel? A guide? Minimum age? Insurance? Tracked in <code>docs/CONTENT-TODO.md</code> .	Pending
Homepage stats — "12k+ guests", "8 yrs"	Real business facts (total historical guests served, actual years trading) that no database here can compute. Confirm the real numbers, or tell me if these are already-approved figures.	Pending
Real guest reviews	The fabricated-review bug is fixed (see §4) — the site now honestly shows zero reviews rather than invented ones. Building trust from here needs real reviews collected over time: export existing ones from TripAdvisor/GetYourGuide/Google, or ask past guests directly.	Ongoing

3 — Business/legal decisions on record, correctly deferred

From `docs/OPEN-QUESTIONS.md`. None of these block the Dunes-only launch — they matter once Route Insolite or mixed bookings become real.

#	QUESTION	OWNER	CURRENT INSTRUCTION
Q1	Who invoices a mixed Route+Dunes trip?	You / accountant	Per-entity invoices, no merchant-of-record — kept as the safe default.
Q2	One reservation per product, or per company?	You	Kept per-company — matches how the camp already works.
Q4	Remedy for the shared invoice-number sequence	Accountant	Highest-severity open item — no safe default exists. Raised with you directly; waiting on the accountant's read before any code touches <code>DocumentSequence</code> .
Q5	Cross-domain checkout (Route + Dunes)?	You	Kept single-brand, single-domain — no mixed cart yet.
Q10	Legal basis for two entities sharing one customer table	Legal/privacy	Technical inventory written (<code>docs/data-sharing-inventory.md</code>) — no legal basis decided. Exposure is currently structural, not active (zero real Route Insolite customers exist yet), but accrues the moment that changes.

4 — Fixed and verified this session

For context — these were real, live bugs, not assumptions, each confirmed working after the fix.

- **Fixed** **Fabricated reviews were live on every page.** No public reviews endpoint existed; every request 401'd and silently served explicitly-fake placeholder content — permanently, and fed into Google's `AggregateRating` schema. Built the real endpoint; site now honestly shows zero reviews.
- **Fixed** **Same bug on the homepage's "4.9★ average rating".** Now derives honestly from real review data (currently: a "New" label in all 6 languages, not a fake number).
- **Fixed** **9 legacy SEO URLs 404'd for real browsers.** next-intl's language auto-detection sent English-preferring first-time visitors to a URL variant that was never built. Extended the rewrites to every locale instead of disabling the (otherwise useful) detection.
- **Fixed** **Guest-checkout accounts were created with an unknowable password.** Password is now emailed via the real welcome template. (A first attempt also tried to force a Keycloak password-change on next login — found live that this broke login entirely for this app's auth architecture, and reverted it the same day.)
- **Fixed** **Backend connections went stale across a Docker/host restart,** causing a real, silent 500 on the booking form. Added a connection-TTL so the pool self-heals.
- **Fixed** Quad Safari's cover photo (an existing, correct asset was never wired in) and a "30 minute" → "30 min" copy inconsistency.
- **Verified** Core booking flow end-to-end (browse → book → account → real reservation), Core Web Vitals (LCP ~1.4s, CLS 0), and the admin backoffice's real dashboard, CMS, and catalogue screens.

5 — Known technical debt, correctly not touched

Real, tracked, and deliberately sequenced — not oversights.

- **Money stored as** `Double`, not `BigDecimal`. Flagged Critical in `ARCHITECTURE.md`. Deliberately not refactored: the project's own rule is tests-first (21 tests exist today against 1,788 lines of pricing logic) — R2 Sprint 6.
- **Invoice company-toggle has no status check.** Tied directly to Q4 above — the correct remedy needs the accountant's input before any code changes.
- **Thin test coverage** (21 tests across ~18,500 LOC). Real, targeted tests were added this session for the exact bugs found — not broad coverage yet.
- `ddl-auto: update` against a live database — no rollback path on schema changes.

6 — Suggested order of attack

- 1 **Rotate the Gmail app password** — 5 minutes, unblocks every transactional email.
- 2 **Export Search Console data** — before touching DNS, or ranking history is at risk.
- 3 **Confirm the remote host** is either decommissioned or has its own secret rotated.
- 4 **Send the real Quad Safari facts** and the real guest/years numbers — quick wins, no engineering needed on your side.
- 5 **Loop in your accountant** on the invoice-sequence question (Q4) — the one item with genuine audit exposure.

Everything in §1–§3 needs you specifically — an account, a business fact, or a decision. Nothing in this report is a "nice to have I forgot" list; every remaining item was either explicitly deferred per your own instructions this session, or is something only you can supply.

Dunes Insolites platform — internal readiness report, prepared by Claude during the pre-launch audit session, 30 Aug 2026. Percentages and statuses reflect direct, live verification against the running application and database — not a static code read.
