

Dunes Insolites SEO & Migration Plan

Replatforming a ranking WordPress site — and untangling two brands competing for one keyword territory

The biggest SEO problem is not technical. You own two live sites, `dunes-insolites.com` and `route-insolite.com`, run by two separate legal entities — and the first one is currently selling and ranking for the second one's products. Nine commercial pages on the camp's site duplicate the travel agency's core offer.

Two owned domains competing on the same queries suppress each other. Fixing that is worth more than every technical item in this document combined.

Prepared for	Abdou Hanafi
Date	25 August 2026
Canonical domain	<code>www.dunes-insolites.com</code>
Languages	French (default, at root) + English (<code>/en</code>)
Legacy site	WordPress + WooCommerce + Yoast · 53 indexed URLs
Sister brand	<code>route-insolite.com</code> — live, French, separate legal entity
Estimated effort	18–24 days (excluding copywriting and translation)

1. Two brands, one keyword territory

This was not visible from the code alone. The backend gave it away: `CompanyType` is an enum of exactly two values, and `InvoiceEmailService` prints a different legal footer, logo and stamp for each.

Dunes Insolites

www.dunes-insolites.com

EL FAOUAR 4264, KÉBILI

Tel/Fax 75 461 016 · GSM 27 391 501

dunesinsolites@gmail.com

What it is: the desert camp at Sabria. Sells nuitées — fixed camp and bivouac — plus on-site activities: camel, quad, sandboarding, dîner bédouin, soirées sous les étoiles, pain de sable.

Route Insolite

www.route-insolite.com

HOUMET SOUK, DJERBA 4180

Tel +216 50 655 844

contact@route-insolite.com

What it is: a licensed travel agency, accredited by the Ministry of Tourism, claiming 40,000+ clients. Sells multi-day Sahara circuits departing Djerba, Tozeur and Tataouine.

The overlap

Nine commercial pages on the *camp's* domain sell the *agency's* product — multi-day, off-site circuits that do not happen at Sabria:

PAGE ON DUNES-INSOLITES.COM	WHOSE PRODUCT IT ACTUALLY IS
/excursion-desert-tunisie-2-jours/	Route Insolite — multi-day circuit
/desert-3-jour/	Route Insolite — multi-day circuit
/6-jours-excursion-desert-tunisien/	Route Insolite — multi-day circuit
/circuit-tataouine-et-chenini-au-depart-de-djerba/	Route Insolite — departs Djerba , the agency's own city
/excursion-tataouine-chenini-desert-tunisie-star-wars/	Route Insolite — off-site excursion
/excursion-dune-journee-a-ksar-ghilane/	Route Insolite — off-site day trip
/day-trip-desert-douz-and-matmata/	Route Insolite — off-site day trip
/tunisie-sahara-en-4x4/	Route Insolite — 4x4 touring
/immersion-saharienne-2-nuits-daventure-en-camp-et-bivouac/	Shared — camp stay inside a circuit

WHY THIS COSTS YOU MONEY

- **Keyword cannibalisation.** For "*excursion désert tunisien 2 jours*" or "*Ksar Ghilane excursion*", Google has two of your pages on two of your domains. It picks one — usually not the one you would choose — and splits the click-through, the links and the authority between them.
- **Diluted topical authority.** Neither domain reads as the definitive source. The camp site looks like a scattered tour operator; the agency site loses the accommodation angle. Both rank worse than a single focused domain would.
- **Brand confusion converts badly.** A visitor who books a Djerba circuit from the camp's site receives an invoice from a different legal entity, with a different address and stamp. That is a support ticket and a refund risk.
- **You are paying twice** to produce, translate and maintain overlapping content.

Recommended territory split

The legal entities already define the boundary. Follow it — do not invent a new one.

TERRITORY	DUNES-INSOLITES.COM	ROUTE-INSOLITE.COM
Core intent	Where you sleep — accommodation	Where you go — itineraries

Owns these queries	nuitée désert, bivouac Tunisie, campement Sahara, desert camp Tunisia, dormir dans le désert, Sabria, Kébili	excursion désert, circuit Sahara, voyage Tunisie, Ksar Ghilane, Tataouine, Star Wars, Matmata, Douz, 4x4, départ Djerba
On-site activities	Owns them — quad, sandboard, chameau, dîner bédouin, soirées sous les étoiles	Links to the camp; does not duplicate the pages
Multi-day circuits	Links to Route Insolite; does not sell them	Owns them
Blog	Camp life, Sabria, when to visit, what to pack	Destinations, itineraries, regional guides

Each domain then links to the other on the pages where the customer genuinely crosses over — a circuit that overnights at the camp, a camp stay a guest wants to extend into a circuit. That is a real editorial relationship between two brands, which search engines handle well; it is duplicate content that they punish.

2. Current state

The legacy site — what you are replacing

Platform	WordPress + WooCommerce + Yoast SEO + Elementor/Templately
Canonical host	<code>www.dunes-insolites.com</code> — with <code>www</code> , per its own sitemap
Indexed URLs	53 — 35 pages, 18 blog posts, plus category and author sitemaps
Language	French-first, with English blog posts alongside
URL style	French, keyword-rich, trailing slash
Commerce	WooCommerce — <code>/mon-compte/</code> , <code>/panier/</code> , <code>/mes-reservations/</code>

Note the lastmod dates: `/services/sejours/`, `/services/tours/`, `/services/activites/`, `/mes-reservations/` and `/detail-service/` were all edited in July–August 2026. Someone is building a booking flow inside WooCommerce in parallel with the Spring Boot backend. Confirm that work is stopped before more of it accumulates.

The new vitrine — technical SEO audit

The foundation is genuinely good. This is not a rescue job.

ITEM	STATE	NOTE
Root metadata, OG, Twitter cards	GOOD	Title template, keywords, images all present in <code>app/layout.tsx</code>
Per-page metadata	GOOD	15 of 16 pages; home inherits correctly from the layout
JSON-LD	GOOD	<code>TouristAttraction</code> on home, <code>Product</code> + <code>Offer</code> on activity and camp pages
<code>AggregateRating</code> discipline	GOOD	Emitted only when reviews exist — the correct call; faking it risks a manual action
<code>generateStaticParams</code>	GOOD	On all three dynamic route families
Image handling	GOOD	<code>next/image</code> in 18 files; only 2 raw <code></code> remain
<code>robots.ts</code>	GOOD	Present, sensible disallows
<code>site.url</code> is a placeholder	BROKEN	<code>https://dunes-insolites.example</code> — poisons every canonical, OG URL and sitemap entry
Sitemap omits all stay pages	BROKEN	<code>/camp</code> and its children absent — your lead product is invisible
Sitemap reads seed data	BROKEN	Imports <code>lib/data/activities</code> , not <code>lib/api</code>
No i18n	MISSING	English-only; <code><html lang></code> hardcoded <code>"en"</code> ; rankings are French
No blog	MISSING	18 legacy posts have nowhere to land
Placeholder social links	BROKEN	<code>https://instagram.com</code> etc. — these become <code>sameAs</code>
No breadcrumbs / Organization schema	MISSING	Both are straightforward additions
Hero video weight	RISK	17 MB video + 12 MB images — Core Web Vitals is a ranking input

3. The work

SEO-01 Decide the brand territory split

business decision

Why: every redirect, sitemap entry and content decision below depends on which domain owns which product. Nothing else in this plan can be finalised first.

Three options for the nine overlapping pages:

1. **Move them to Route Insolite (recommended).** Cross-domain 301 each page to its equivalent on `route-insolite.com`, creating the target page first if it does not exist. Consolidates authority onto the brand that legally sells the product. Expect a 2–3 month dip before the target pages recover and exceed the split position.
2. **Keep them as camp-anchored content.** Rewrite each page from the camp's perspective — "your circuit, with a night at our camp" — and hand the booking off to Route Insolite. Keeps the traffic on the camp domain, removes the duplication, but requires real rewriting, not a redirect.
3. **Leave both.** Cheapest today, and the cannibalisation continues. Only defensible if the two entities are genuinely competing businesses that happen to share a backend — which the shared user table and shared reservation flow suggest they are not.

Done when: all 53 legacy URLs have an owning domain and a decision recorded.

SEO-02 Fix the placeholder domain

30 min

`lib/site.ts:12`

Why: `site.url` feeds `metadataBase`, so every canonical, Open Graph URL, sitemap entry, `robots.txt` Sitemap directive and JSON-LD image URL currently points at a domain that does not exist. Nothing is indexable until this changes.

```
- url: "https://dunes-insolites.example",  
+ url: "https://www.dunes-insolites.com", // www - matches the legacy canonical host
```

Replace the placeholder socials in the same file with real profile URLs — they become `sameAs` in structured data and are how search engines connect the site to the brand's entities.

Done when: a built page's canonical, OG URL and sitemap all read `https://www.dunes-insolites.com/...`

SEO-03 URL strategy — keep the French slugs, do not redirect them

3d

Why: a 301 preserves most authority but not all, and every redirect is a chance to lose a position. The strongest migration is one where the URL does not change at all. The legacy slugs are also better targets than the new ones: `/nuitee-campement-desert/` carries the keyword; `/camp/camp-night` carries nothing.

- **French at the root, no locale prefix.** That is where the rankings live. English goes under `/en`. In `next-intl`: `defaultLocale: 'fr', localePrefix: 'as-needed'`.
- **Each entity stores its legacy French slug verbatim** as its public route key, plus an English slug for the `/en` tree. This requires the backend change described in the Full-Stack Plan.
- **Set `trailingSlash: true`** in `next.config.ts`. WordPress serves `/nuitee-campement-desert/`; Next.js drops the slash by default, which would turn all 53 legacy URLs into redirects. This single setting is the most commonly missed step in a WordPress→Next migration.
- Only genuinely dead URLs get a 301, each to its closest topical equivalent — **never to the homepage**, which Google treats as a soft 404.

Done when: a crawl of the 53 legacy URLs against staging returns `200` for every surviving page — not 301, not 404.

Legacy URL map

KEEP serve this exact URL · **MOVE** cross-domain 301 to `route-insolite.com`, pending SEO-01 · **MAP** functional page, `noindex`

LEGACY URL	ACTION	DESTINATION
/	KEEP	FR homepage
/presentation-campement-dunes-insolites/	KEEP	About — "Le campement"
/nuitee-campement-desert/	KEEP	Stay — fixed camp
/bivouac-desert-tunisie/	KEEP	Stay — bivouac
/sandboarding-desert/	KEEP	Activity — sandboarding
/quad-desert/	KEEP	Activity — quad
/bedouin-diner-sahara-tunisien/	KEEP	Activity — dîner bédouin
/soirees-sous-les-etoiles/	KEEP	Activity — soirées
/le-pain-de-sabel/	KEEP	Activity — pain de sable
/dunes-insolites-camp-gallery/	KEEP	Gallery
/dunes-insolites-sabria-evasion-sahara/	KEEP	Brand/landing page
/services/ + /sejours/ /tours/ /activites/	KEEP	Listing pages — three product families
/ou-se-situe-le-desert-en-tunisie/	KEEP	Informational — strong top-of-funnel
/meteo-dans-le-desert-tunisien-quand-visiter.../	KEEP	Informational — high intent
/blog-desert/ · /blog-sahara-tunisie/	KEEP	Blog indexes
18 blog posts	KEEP	Migrate verbatim, slugs unchanged
/excursion-desert-tunisie-2-jours/	MOVE	route-insolite.com equivalent
/desert-3-jour/	MOVE	route-insolite.com equivalent
/6-jours-excursion-desert-tunisien/	MOVE	route-insolite.com equivalent
/excursion-dune-journee-a-ksar-ghilane/	MOVE	route-insolite.com equivalent
/circuit-tataouine-et-chenini-au-depart-de-djerba/	MOVE	route-insolite.com equivalent
/excursion-tataouine-chenini-...-star-wars/	MOVE	route-insolite.com — strong keyword, place carefully
/day-trip-desert-douz-and-matmata/	MOVE	route-insolite.com equivalent
/tunisie-sahara-en-4x4/	MOVE	route-insolite.com equivalent
/immersion-saharienne-2-nuits-.../	KEEP	Camp + bivouac — genuinely the camp's product
/tour-desert-tunisia/	MOVE	Review intent before moving — EN generic
/mon-compte/ /mes-reservations/ /panier/	MAP	New account pages · noindex
/mot-de-passe-oublie/ /detail-service/ /review/	MAP	Functional · noindex

SEO-04 Wire next-intl for FR + EN

5d

- `defaultLocale: 'fr', localePrefix: 'as-needed'` — French at root, English at `/en`.
- `LanguageSwitcher` already exists and honestly marks unavailable locales. Flip FR and EN to `available: true`; delete the locales you are not shipping rather than leaving them disabled forever.
- `hreflang` on every page via `metadata.alternates.languages`, including `x-default` → French.
- `<html lang>` is hardcoded `"en"` in `app/layout.tsx` — must become the active locale.
- Localise the JSON-LD too: `name`, `description`, `inLanguage`.
- Content translations come from the backend (see the Full-Stack Plan); UI strings live in message catalogues.

Done when: both trees render fully translated, hreflang validates, and no English string appears on a French page.

SEO-05 Migrate the blog — 18 posts

4d

Why: the new vitrine has no blog. Those posts target exactly the queries that feed a camp booking — *"quand visiter le désert tunisien"*, *"best desert camping tunisia"*, *"tarifs excursion désert tunisien"*. Dropping them removes the entire discovery layer above your product pages.

Use MDX in-repo, not a CMS. Eighteen posts published a few times a year does not justify a headless CMS and its failure modes. Export from WordPress, convert to MDX, keep slugs verbatim, keep images, add `Article` JSON-LD, build an index plus per-post routes in both locales.

While migrating, tag each post to its brand territory per SEO-01. Posts about circuits and destinations (`/circuit-4-jours-...`, `/ksar-ghilane-desert-tunisia/`, `/guide-excursions-desert-tunisien/`) may belong on Route Insolite.

Done when: all 18 legacy post URLs return 200 with content intact.

SEO-06 Rebuild the sitemap from live data, both locales

1d

`app/sitemap.ts`

Why: it imports `@/lib/data/activities` — seed data — and omits `/camp`, `/camp/[slug]` and `/camp/[slug]/[accommodation]` entirely. Stays are the lead product and no stay page is listed.

Rebuild from `lib/api`; include stays, activities, blog posts and listing pages; emit both locales with `alternates`; use real `lastModified` values instead of `new Date()` on every build, which tells crawlers nothing.

Done when: the sitemap lists every indexable URL in both locales and matches a crawl of the site.

SEO-07 Extend structured data

2d

- `LodgingBusiness` in the root layout, replacing bare `TouristAttraction` — a camp selling overnight stays qualifies, and it unlocks richer results. Include real `sameAs`, `telephone`, `address`, `geo`, `priceRange`.
- `BreadcrumbList` on all nested routes — absent everywhere today.
- `FAQPage` on the safety and stay pages, where the copy genuinely answers questions.
- `Article` on blog posts (SEO-05).
- Keep the existing `AggregateRating` discipline: real reviews only.

Done when: the Rich Results Test passes clean on home, a stay, an activity and a blog post.

SEO-08 Core Web Vitals — the hero is the risk

3d

Why: `public/video` is 17 MB, `public/images` 12 MB, and the homepage hero plays camp footage. On a mobile connection in-market that is an LCP and data-cost problem, and Core Web Vitals is a live ranking input.

- Measure first on a throttled mobile profile. Do not optimise blind.
- Poster image as the LCP element; video lazy with `preload="none"`; respect `prefers-reduced-motion`; skip the video on save-data and narrow viewports.
- Re-encode to AV1/VP9 with an H.264 fallback and cap the bitrate.
- Audit the two remaining raw `<img>` tags.

Done when: LCP < 2.5s and CLS < 0.1 on a throttled mobile run of the homepage and a stay page.

- **Before anything:** full crawl of the live site archived — URLs, titles, meta descriptions, H1s — plus a Search Console export of queries, positions, impressions and top pages. **This is your only baseline and it cannot be recovered afterwards.**
- Verify the new property in Search Console; submit the new sitemap; keep the old property to watch the migration.
- Cut over on a low-traffic day. Keep WordPress restorable for at least 30 days.
- Day 1: crawl all 53 legacy URLs; assert 200, or an intended 301. Day 2–30: watch coverage, 404s, and positions on the top 20 queries.
- Preserve WooCommerce customer accounts and order history, or tell customers plainly that it is going away — `/mes-reservations/` implies people have booking history there.
- If SEO-01 moves pages cross-domain, expect a 2–3 month dip on those queries. Budget for it and do not panic-revert in week three.

Done when: 30 days post-cutover, organic sessions and top-20 positions are at or above the pre-migration baseline.

4. Effort, sequence and gates

ID	SEV	TASK	EST.	DEPENDS ON
SEO-01	CRIT	Decide brand territory split	decision	—
SEO-02	CRIT	Fix placeholder domain + real socials	30 min	—
SEO-03	CRIT	URL strategy, legacy slugs, trailingSlash	3d	SEO-01
SEO-04	HIGH	next-intl, FR default + EN	5d	SEO-03, backend locales
SEO-05	HIGH	Blog migration, 18 posts to MDX	4d	SEO-01, SEO-04
SEO-06	HIGH	Sitemap from live data, both locales	1d	SEO-04, public API
SEO-07	MED	Structured data extension	2d	SEO-02
SEO-08	HIGH	Core Web Vitals	3d	—
SEO-09	CRIT	Cutover + 30-day monitoring	3d	everything
Total			18–24d	

Excludes copywriting and translation, which are a content cost rather than a developer one, and excludes creating any new pages on route-insolite.com should SEO-01 choose to move products there.

Suggested order

1. **Today:** SEO-02 (30 minutes) and the pre-migration baseline archive from SEO-09. The baseline is time-sensitive — every day you wait is a day of history you cannot capture.
2. **Week 1:** SEO-01 decision. Everything else is blocked behind it.
3. **Weeks 2–3:** SEO-03 URL strategy, in step with the backend slug work.
4. **Weeks 4–6:** SEO-04 intl and SEO-05 blog, the two largest items.
5. **Weeks 7–8:** SEO-06, SEO-07, SEO-08.
6. **Week 9:** SEO-09 cutover, then monitor for 30 days.

DO NOT CUT OVER UNTIL ALL OF THESE ARE TRUE

- ☐ Pre-migration crawl and Search Console baseline archived
- ☐ All 53 legacy URLs return 200 on staging, or an intended 301
- ☐ `trailingSlash: true` confirmed, verified against legacy URLs
- ☐ `site.url` is the real canonical host, with `www`
- ☐ hreflang validates in both directions, `x-default` → French
- ☐ Sitemap matches a live crawl, both locales, includes stays and blog
- ☐ LCP < 2.5s on throttled mobile
- ☐ WordPress restorable for 30 days
- ☐ Search Console verified on the new property, sitemap submitted

THE ONE THING TO GET RIGHT

Everything technical in this document is recoverable. A botched URL migration is not — you cannot re-earn five years of accumulated authority by fixing a config afterwards. **Archive the baseline, keep the legacy slugs, and set `trailingSlash: true`.** Those three things protect more value than the rest of the plan combined.

covering backend, espace client / espace admin separation, and the shared-data-model question.
